Levelling Lines Made True with LaserMark

A smart new range of laser levelling devices for precise levelling of indoor and outdoor projects is now available in the UK from Mans International. The LaserMark® Series is aimed at all building, construction, and machine installers and will appeal to DIY enthusiasts, facilities managers and professional contractors.

LaserMark replaces traditional manual levelling screws or bubbles, with a simple push button operation that saves time and effort. The integral laser beam technology delivers sharp, accurate horizontal and/or vertical laser beam lines over any surface, that is safe for both interior or exterior use. Automatic self levelling in premier models guarantees true horizontal and vertical lines, even if positioned on an uneven surface. Similarly, an anti-drift system automatically stops operation if the device is knocked accidentally out of range after set-up.

Levelling applications are numerous. Interior work includes machine installation, decorating, finish carpentry, drop ceiling installation, plumbing stencilling and wallpaper application, carpentry, 90 degree joint and edge alignment, floor & wall tiling, cabinet alignment, shelves and fixtures, wall partition installation, door, wall and window framing.

Exterior levelling work includes grading masonry, batter boards and foundations, setting concrete forms, checking depth of trenches, marking elevation, septic work, installing pools, building decks and patios, flagpoles, landscaping, level driveways, fencing and excavating.

-more-

The ranges starts with affordable single beam torpedo levellers, point and shoot distance meters, ceiling plumb bobs, and the compact GIZMO with dual cross laser line. Top of the range comes automatic self levelling rotary laser versions, and five beam multiple laser systems for professional applications. Optional extras include hand-held laser detectors (for outdoor use with self levelling models), tripods, safety glasses, and remote controls (for premier models).

LaserMark® is manufactured by CST/Berger, USA. This range is being distributed in the UK by Mans International, a new company that combines years of industry expertise with competitively priced solutions for projects big and small.
